Week of March 20, 2023

Last week's newsletter delved into Silicon Valley Bank and what went wrong. We also discussed the broader implications. You can read it here: [Newsletter - Moulton Wealth](#).

We've been warning about the risks building in the financial system for some time. The fact that they didn't immediately cause a bear market may have led some to believe they weren't real. Instead, much like a boiling pot it takes time, and may appear little is changing until the lid flies off.

ATTEND OUR...

RISK MANAGEMENT

SEMINAR

BRING A GUEST

- **MARCH 22ND @ 9:30 AM – SPOKANE**
- **MARCH 29TH @ 11:00 AM - RICHLAND**

CALL **509-922-3110** TO RESERVE A SEAT *OR IF YOU WANT A SECOND OPINION ON YOUR PORTFOLIO!*

Risk happens slowly and then all at once.

We're being told that Silicon Valley Bank's issues were unique to them, and regardless that the Fed and FDIC's actions have contained the problem.

But is it true?

Honestly, no one knows. And that's the real problem.

We did find out this weekend, that Credit Suisse, the 167-year-old Swiss bank, also has "problems". Credit Suisse is ranked among the top 30 globally systemically important banks, i.e., "too big to fail". Last Wednesday alone their stock fell as much as -30% before they were thrown a \$53.7 B lifeline from the Swiss National Bank.

This weekend they accepted a \$3.25 B buyout offer from UBS, an amount about 60% less than the bank was worth when the stock price closed on Friday. This after the stock was already down over -24% last week.

Normally a buyout would require shareholder approval. In an unprecedented move, however, the Swiss government agreed to change the law so a shareholder vote won't be required, in an effort to remove uncertainty from the deal.

To be fair, Credit Suisse has had issues for some time. Their stock is down almost 84% since the beginning of 2021.

But that's how financial tightening / stress impacts the economy. It shows up in the weaker players first, but that doesn't mean it stops there.

Please see our new website www.MoultonWealth.com. Of the many improvements, the most important is we now host podcasts of past radio shows, allowing you to listen at your convenience. You can also read all the past newsletters and take the test to find your Risk Number.

Remember 2008? When Bear Stearns went under, we were told their issues were unique to them and that regardless, the Fed brokered purchase by JP Morgan had contained the problem. In fact, the S&P-500 climbed about 8.4% over the next two months. It then fell -52.6% over the following 10 months.

That's not to say this is a repeat of the Great Financial Crisis. It's to say we don't yet know what it is.

LISTEN TO RIAL'S AND DON'S RADIO SHOW,

"YOUR MONEY MATTERS"

EVERY SATURDAY MORNING AT

8:00 AM ON KXLY RADIO CHANNEL 920 AM IN SPOKANE

AND AT 9:30 AM ON NEWSTALK RADIO CHANNEL 870 AM IN THE TRI-CITIES AREA

LISTEN LIVE AT WWW.NEWSTALK870.AM AGAIN AT 9:30 EACH SATURDAY MORNING

OR VISIT OUR WEBSITE MOULTONWEALTH.COM FOR PODCASTS

And that we don't know is exactly the point.

If you were interviewing me to be your personal driver, and I told you I drive at the speed limit whether night or day, whether sunny or raining or even snowing because “you can't time accidents”, would you hire me?

My guess is you'd be more comfortable with someone who adjusted their speed to the conditions, even though admittedly no one knows for certain if there will be an ice patch or a wreck ahead.

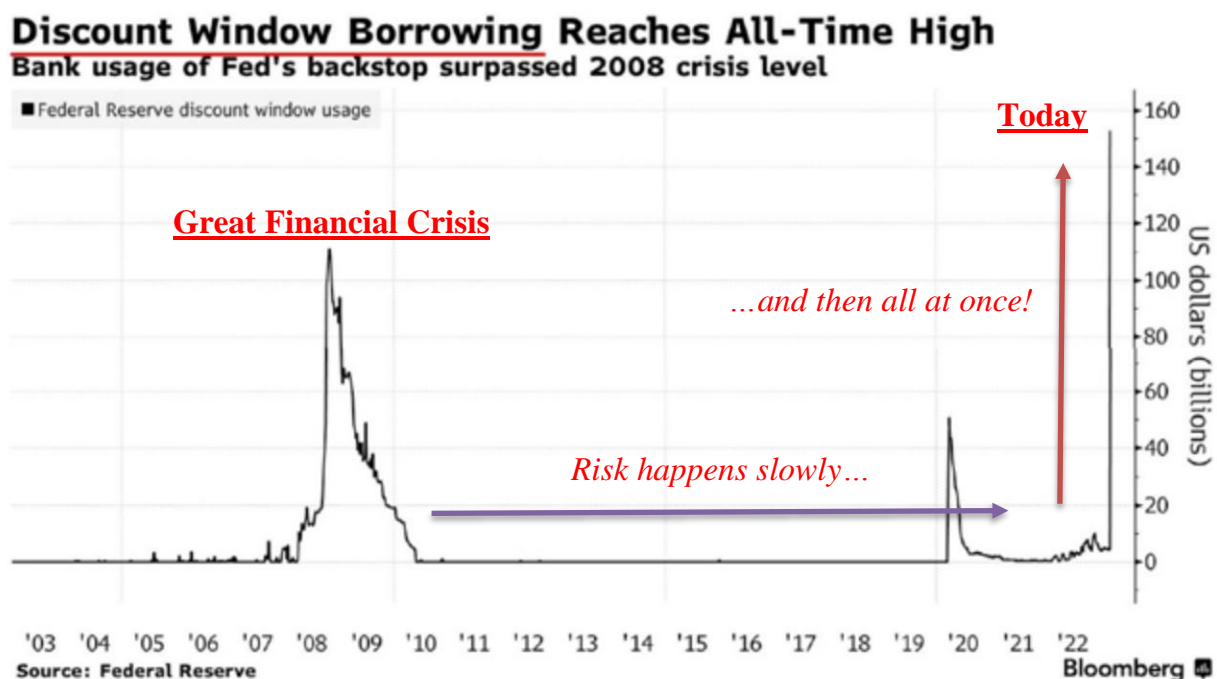

Yet in investing, we're told to do just the opposite. We're told to hold steady at 70 mph whether during the day in the middle of summer or in a night time snow storm, because “you can't time the market”.

Adjusting to the particulars of today instead of focusing on 100-year averages is called “risk managed investing”. Buy and hold is more akin to “risk ignored investing”.

The Federal Reserve is often called the “lender of last resort”. It means when all else fails, banks and other financial institutions turn to the Fed for liquidity. They have long had what's called the “Discount Window” for these firms to borrow for short term liquidity during times of stress. Historically they avoid it because the rate charged is purposely higher than what's available through the markets. It was intentionally constructed not as an easy place to get funds, but instead a place to borrow when you have no other options.

Following is a chart from John Mauldin of MauldinEconomics.com (*we added notes*).

What's it mean?

Source: Bloomberg

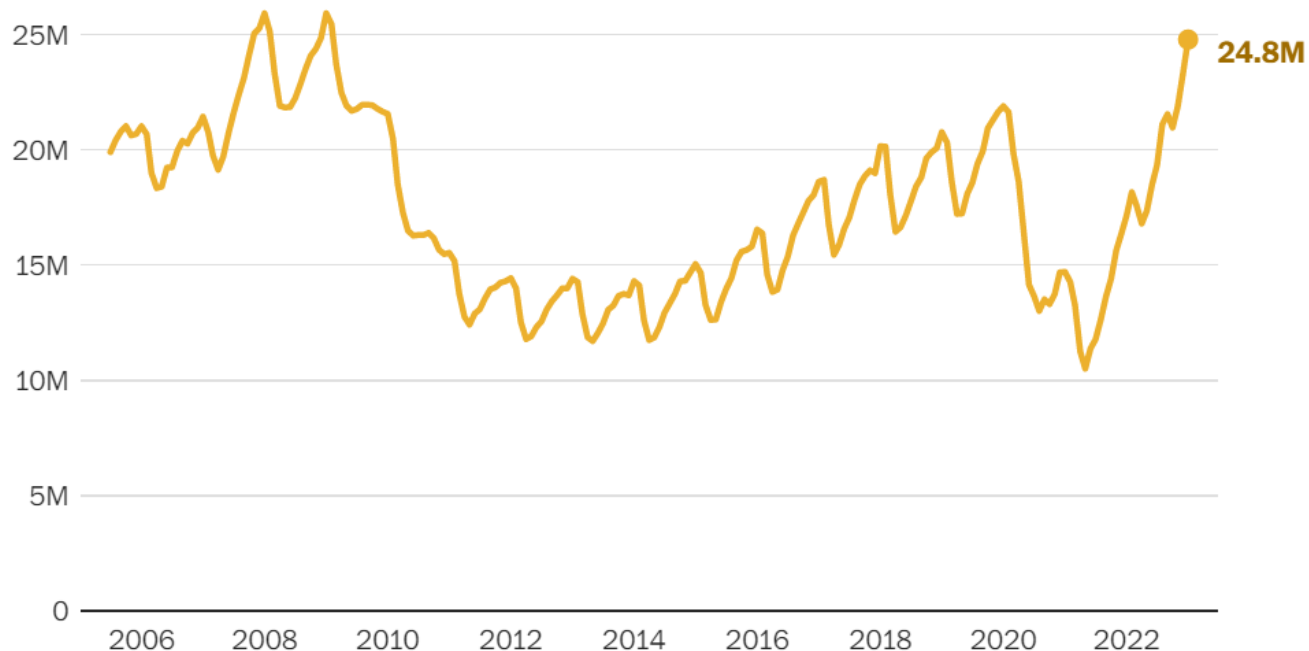

On the one hand, it means the discount window is filling its role of providing liquidity to troubled firms. On the other hand, the sheer magnitude of borrowing doesn't make us believe that the problems we've seen so far are unique.

A financial crisis would obviously not be good, but consumers are 70% of GDP. How are they doing?

Moody's Analytics analyzed Equifax data. They determined that nearly 25 million people are behind on their credit card, auto loan or personal loan payments. They noted "The nation has not seen anything that high since 2009 in the midst of the Great Recession."

Total delinquent consumer loans in the United States

Includes credit card, auto loans and consumer finance loans

Not seasonally adjusted

THE WASHINGTON POST

The lid on that boiling pot is starting to rattle. Time left to protect yourself may be running out.

You may already wonder if it's too late to make changes to your portfolio. After all, you don't want to be the dummy who sells at the bottom.

It is very unlikely we are anywhere near the bottom. In fact, it's more likely to be just beginning.

If you still have the same portfolio allocation you had during the bull market, we would ask “why”? The risk profile of the economy and market has changed dramatically and risk will likely continue to rise. Wouldn't it make sense to adjust your portfolio to what is actually happening as opposed to the average of what's happened over the last century?

To be clear, we'll have a great buying opportunity at some point in the future. Usually that happens with the market crashing and most investors disgusted with the thought of investing. If you lose much of your net worth, participating will be difficult.

“You can't buy low if you don't sell high.”

Patience and asset protection will be key.

In the Great Financial Crisis, the S&P-500 fell -24% from the start on October 9, 2007 until the Lehman bankruptcy on September 15, 2008. That was close to a year, and not that far off from what we've lived through this year.

Then in just over a month from September 15, 2008 to October 27, 2008 the S&P-500 fell **ANOTHER** -28.8%. And from September 15, 2008 to the ultimate bottom, about 5 months later, it fell **ANOTHER** -43%.

Not only do bear markets normally unfold in three stages with the last being the most virulent, it also demonstrates that risk happens slowly and then all at once.

***What is your defensive plan?
There's still time.***

Call or attend a seminar to hear about ours.

Remember, we have a feature on our website: www.MoultonWealth.com to help you measure your risk tolerance. The problem with trying to decide how much risk to take is we all want to be aggressive when the market is going up, but conservative when it's going down. That's why a sell discipline is important. However, the first line of defense

What's Your Risk Number? 

is always our allocation. This approach to measuring risk gives a number by making investors trade off gains and losses. Just click the button to see where you stand.

Get a physical! We invite you to attend a seminar and come in for a “financial physical”, even if you think your current approach is fine. Much like going to the doctor for a physical despite feeling great, you want to make sure any negative issues you may not be aware of are caught early and addressed. For example...

- Do you need a process to help manage losses during the next bear market?
- Have you addressed your investment process and adjusted it for what is going on in the world?
- If not, what are you waiting for?

At the bottom of the 2007 - 2009 bear market the S&P-500 index returned to levels last seen in 1996.

The drop didn't retrace only a few months or even a couple years.

We discuss many of these issues and more on the weekly radio show and invite you to listen.

WEEKLY FOCUS – THINK ABOUT IT

***“The lid on that boiling pot is starting to rattle.
Time left to protect yourself may be running
out.”***

The Barclays Global Aggregate Bond Index (formerly Lehman Brothers Global Aggregate Index), is an unmanaged market-capitalization-weighted benchmark, and tracks the performance of investment-grade fixed income securities denominated in 13 currencies. The index reflects reinvestment of all distributions and changes in market prices.

The Barclays U.S. 1-10 Year TIPS Index is an unmanaged index composed of inflation-protected public obligations of the U.S. Treasury that have a remaining maturity of one to ten years.

The Barclays U.S. Aggregate Bond Index is an unmanaged benchmark index composed of U.S. securities in Treasury, Government-Related, Corporate, and Securitized sectors. It includes securities that are of investment-grade quality or better, have at least one year to maturity, and have an outstanding par value of at least \$250 million.

The Barclays U.S. TIPS Index is an unmanaged index composed of all U.S. Treasury Inflation- Protected Securities rated investment grade, have at least one year to final maturity, and at least \$250 million par amount outstanding.

The Barclays U.S. Treasury Index is an unmanaged index composed of U.S. Treasuries.

The CDX IG 12 is a benchmark high-grade derivatives index, which measures the cost of insuring a basket of U.S. investment-grade corporate debt against defaults.

The Chicago Board Options Exchange Volatility Index (VIX) tracks the expected volatility in the S&P 500 over the next 30 days. A higher number indicates greater expected volatility. Common usage: The Chicago Board Options Exchange Volatility Index (VIX), a barometer of market volatility.

The Dow Jones Industrial Average is a widely followed market indicator based on a price-weighted average of 30 blue-chip stocks that trade on the New York Stock Exchange which are selected by editors of The Wall Street Journal.

The Dow Jones Wilshire Real Estate Securities Index (RESI) is used to measure the U.S. real estate market and includes both real estate investment trusts (REITs) and real estate operating companies (REOCs). It is weighted by float-adjusted market capitalization.

The JP Morgan Emerging Market Bond Index is a total-return, unmanaged trade-weighted index for U.S. dollar-denominated emerging-market bonds, including sovereign debt, quasi-sovereign debt, Brady bonds, loans, and Eurobonds.

The JP Morgan EMBI Global Diversified Index tracks the performance of external debt instruments (including U.S.-dollar-denominated and other external-currency-denominated Brady bonds, loans, Eurobonds and local market instruments) in the emerging markets.

The JP Morgan GBI-EM Global Diversified Index tracks the performance of local-currency bonds issued by emerging market governments.

The MSCI World Index is a free float-adjusted market capitalization weighted index that is designed to measure the equity market performance of developed markets. The MSCI World Index represents 23 developed market countries.

The MSCI All Country World Index is a market-capitalization-weighted index composed of over 2,400 companies, and is representative of the market structure of 46 developed and emerging market countries. The index is calculated with net dividends reinvested in U.S. dollars.

The MSCI EAFE Index is an unmanaged, market-capitalization-weighted equity index that represents the developed world outside North America.

The MSCI Emerging Markets Index is a free float-adjusted market-capitalization-weighted index designed to measure the performance of global emerging market equities.

The NASDAQ Composite Index is a market-value-weighted index of all common stocks listed on the National Association of Securities Dealers Automated Quotations (NASDAQ) system.

The Russell 1000 Index includes 1000 of the largest U.S. equity securities based on market cap and current index membership; it is used to measure the activity of the U.S. large-cap equity market.

The Russell 2000 Index includes 2000 small-cap U.S. equity names and is used to measure the activity of the U.S. small-cap equity market.

The S&P 500 Index is a capitalization-weighted index made up of 500 widely held large-cap U.S. stocks in the Industrials, Transportation, Utilities and Financials sectors.

Investing Terminology

Alpha is a measure of a portfolio's return above a certain benchmarked return.

Alternative Investments are investments that are not one of the three traditional asset types (stocks, bonds and cash). Alternative investments include hedge funds, managed futures, real estate, commodities, and derivatives contracts.

Asset-Backed Securities (ABS) are bonds backed by a pool of loans or accounts receivable and commonly include payments from credit cards, auto loans and mortgage loans.

Austerity refers to measures taken by a country's government in an effort to reduce expenditures and a budget deficit.

Beta is a measure of the volatility or systematic risk of a security or a portfolio in comparison to the market as a whole.

Book-to-Price Ratio is the inverse of the price-to-book ratio, which is calculated as the market value of a security divided by its book value. A lower the price-to-book ratio for a security may mean the security is undervalued, and vice versa (the higher the book-to-price ratio, the better the value).

Commercial Mortgage-Backed Securities (CMBS) are pools of commercial mortgage loans that are packaged together and sold to the public. They are usually structured in tranches, or classes of risk, so that investors can determine how much risk they want to take on. In general, CMBS carry less prepayment risk than loans backed by residential mortgages.

Corporate Bonds are debt securities issued by corporations to raise money; these bonds usually pay higher coupon rates than government or municipal bonds.

Correlation Risk refers to the change in the marked to market value of an asset when the correlation between the underlying assets changes over time.

Credit Ratings are an assessment of the risk of default of a company or country. The higher the credit quality (or rating), the lower the perceived risk of default.

Cyclical Sectors or Stocks are those whose performance is closely tied to the economic environment and business cycle. Managers with a pro-cyclical market view tend to favor stocks that are more sensitive to movements in the broad market and therefore tend to have more volatile performance.

Debt-to-Equity Ratio is calculated as long-term debt divided by common shareholders' equity, and measures the amount of a firm's leverage, or debt.

Donor Advised Funds are private funds administered by a third party and created for the purpose of managing charitable donations on behalf of an organization, family, or individual.

Duration is a measure of a security's price sensitivity to changes in interest rates. Specifically, duration measures the potential change in value of a bond that would result from a 1% change in interest rates. The shorter the duration of a bond, the less its price will potentially change as interest rates go up or down; conversely, the longer the duration of a bond, the more its price will potentially change.

Excess Returns are investment returns from a security or portfolio that exceed a benchmark or index with a similar level of risk.

Grantor Retained Annuity Trust is an estate planning technique that minimizes the tax liability existing when intergenerational transfers of estate assets occur. An irrevocable trust is created for a certain term or period of time. The individual establishing the trust pays a tax when the trust is established. Assets are placed under the trust and then an annuity is paid out every year. When the trust expires, the beneficiary receives the assets estate and gift tax free.

High Yield Debt is rated below investment grade and is considered to be riskier.

Managed Futures strategies use futures contracts as part of their overall investment strategy. They provide portfolio diversification among various types of investment styles and asset classes to help mitigate portfolio risk in a way that is not possible in direct equity investments.

Market Capitalization is calculated as the number of company shares outstanding multiplied by the share price, and is used to determine the total market value of a company.

Momentum is the rate of acceleration for an economic, price or volume movement; it is used to locate trends within the market.

Mortgage-Backed Securities (MBS) are pools of mortgage loans that are packaged together and sold to the public. They are usually structured in tranches, or classes of risk, so that investors can determine how much risk they want to take on.

Option-adjusted spreads estimate the difference in yield between a security or collection of securities and comparable Treasuries after removing the effects of any special features, such as provisions that allow an issuer to call a security before maturity.

Peripheral Eurozone Countries are those countries in the Eurozone with the smallest economies.

Price-to-Book Ratio is calculated as the market value of a security divided by its book value. A lower the price-to-book ratio for a security may mean the security is undervalued.

Private Foundations are charitable organizations that do not qualify as public charities by government standards. A private foundation is a nonprofit organization which is usually created via a single primary donation from an individual or a business and whose funds and programs are managed by its own trustees or directors.

Quantitative Easing refers to expansionary efforts by central banks to help increase the supply of money in the economy.

Recapitalized/recapitalization refers to injecting fresh equity into a company or a bank, which can be used to absorb future losses. This generally takes place through the company issuing new shares. In the case of a government or organization recapitalizing a bank, it usually results in the government or organization owning a stake in the bank.

Spreads: Yield spreads represents the difference in yields offered between corporate and government bonds. If they tighten, this means that the difference has decreased. If they widen, this means the difference has increased.

Standard Deviation: Statistical measure of historical volatility. A statistical measure of the distance a quantity is likely to lie from its average value. It is applied to the annual rate of return of an investment, to measure the investment's volatility (risk). Standard deviation is synonymous with volatility, in that the greater the standard deviation the more volatile an investment's return will be. A standard deviation of zero would mean an investment has a return rate that never varies.

Treasuries are U.S. government debt obligations that are backed by the full faith and credit of the government. Often, they are used as a proxy for a risk-free asset when comparing other risky assets.

Yield Curves illustrate the relationship between the interest rate, or cost of borrowing, and the time to maturity. Yields move inversely to prices. The Barclays Capital 1-10 Year US TIPS Index: Barclays Capital 1-10 Year US TIPS Index measures the performance of inflation-protected public obligations of the U.S. Treasury that have a remaining maturity of one to ten years.
