Week of January 13, 2025

Last week's newsletter considered the question of whether the economy would gently return to "normal," after the most shocking five years in modern economic history. Not to bury the lead, Bain & Company argues that *'it isn't likely.'* Find out what it means for your portfolio by reading the newsletter here: [Newsletter - Moulton Wealth](#).

ATTEND OUR...

FINANCIAL & TAX PLANNING SEMINAR

Including the "WIDOW'S PENALTY"

BRING A GUEST

➤ **JANUARY 21ST - SPOKANE**

➤ **JANUARY 28TH - RICHLAND**

CALL **509-922-3110** TO RESERVE A SEAT OR IF YOU
WANT A SECOND OPINION ON YOUR PORTFOLIO!

Last Saturday's radio show reviewed the most recent jobs data. We also discussed a piece by Lance Roberts explaining how GDP, corporate profits and stock prices all follow each other... at least eventually. Where are we in that cycle? You can listen to past radio shows here: [Radio Show - Moulton Wealth](#).

Please see our website www.MoultonWealth.com. Of the many improvements, the most important is we now host podcasts of past radio shows, allowing you to listen at your convenience. You can also read all the past newsletters and take the test to find your Risk Number.

On the radio show, we discussed Lance Robert's contention that eventually stock prices follow corporate profits, which in turn follow GDP. If he's correct, you should expect anything from a pullback, to an outright bear market.

But remember, stock prices can become decoupled from those fundamentals for long periods of time. If we consider the "Dot.com" bubble from the late 1990s into the early 2000's, we can see it in action. For years, stock prices continued to stretch further and further from underlying fundamentals, leading many to contend that those economic realities no longer mattered. In the end, they did matter, and the magnitude of the bear market tells you how much. The S&P-500 fell about **-50%** while the NASDAQ approached an **-80%** decline!

Why do prices diverge so much from fundamentals?

Of course, it's the age-old human reality of "fear" and "greed".

But what allows it to become extreme can be increasingly traced to "*global liquidity*." Global liquidity is simply the amount of capital available in the global economy to invest in risk assets, such as stocks, real-estate and bonds.

Central banks play a huge role in providing, or removing, global liquidity.

- QE or Quantitative Easing defines a process used by central bankers to increase, or add, liquidity.
- QT or Quantitative Tightening defines a process used by central bankers to decrease, or remove, liquidity.

We need look back no further than the Covid crisis to see global liquidity in action. Covid resulted in the world economy essentially shut down by governmental decree. It wasn't just the U.S. From China, to the E.U., to Russia, governments largely shuttered their economies to combat the spread of the disease. Logically, this should have been a huge negative hit to GDP, to corporate profits, and ultimately to stock prices.

LISTEN TO RIAL'S AND DON'S RADIO SHOW,

“YOUR MONEY MATTERS”

EVERY SATURDAY MORNING AT

8:00 AM ON KXLY RADIO CHANNEL 920 AM IN SPOKANE

AND AT 9:30 AM ON NEWSTALK RADIO CHANNEL 870 AM IN THE TRI-CITIES AREA

LISTEN LIVE AT WWW.NEWSTALK870.AM AGAIN AT 9:30 EACH SATURDAY MORNING

MONEY MATTERS

*Get Moulton Wealth Management's
Advice Every Saturday Morning!*

509-922-3110

And initially it was. The stock market fell over 30% in just over a month, around March 2020, as investors suddenly realized corporate profits would possibly be halved.

But a funny thing happened. Globally, central banks added over \$10 trillion to the world economy. Just in the U.S., considering what congress and the Fed did in concert, an estimate of \$8 trillion isn't crazy.

Who cares about profits and stocks as a "units of business ownership?" All that money had to go somewhere, and much, if not most, flowed into stocks. Supply and demand alone could predict the outcome: stock prices rose dramatically in the face of an economic shutdown, and horrible economic fundamentals.

The same can happen in reverse. When inflation became too difficult to ignore, the Fed started raising rates in 2022. Higher rates remove liquidity. Accordingly, stocks, bonds and real-estate all fell together.

Think of liquidity like the tide. When it rises, it lifts all boats, some more than others. When the tide goes out, even the most buoyant boats will fall.

So where is liquidity headed? That's the \$65 million question.

CrossBorderCapital tracks global liquidity. Their model contends we should still see an increase in liquidity into mid / late 2025, but then it may begin to roll over. However, as can be seen on the following chart, liquidity (black line) doesn't always follow the path that the model thinks it should. This means liquidity could go higher / last longer than expected, or it may rollover starting today.

Global Liquidity Cycle (Advanced Economies)

Source: CrossBorder Capital, US Federal Reserve, People's Bank of China, ECB, Bank of Japan, IMF

This is why we think it so important to track all the data, every day.

If inflation continues to rise (which is our base case), it can cause global liquidity to dry up sooner than expected. To fight inflation, it requires central banks to reduce liquidity.

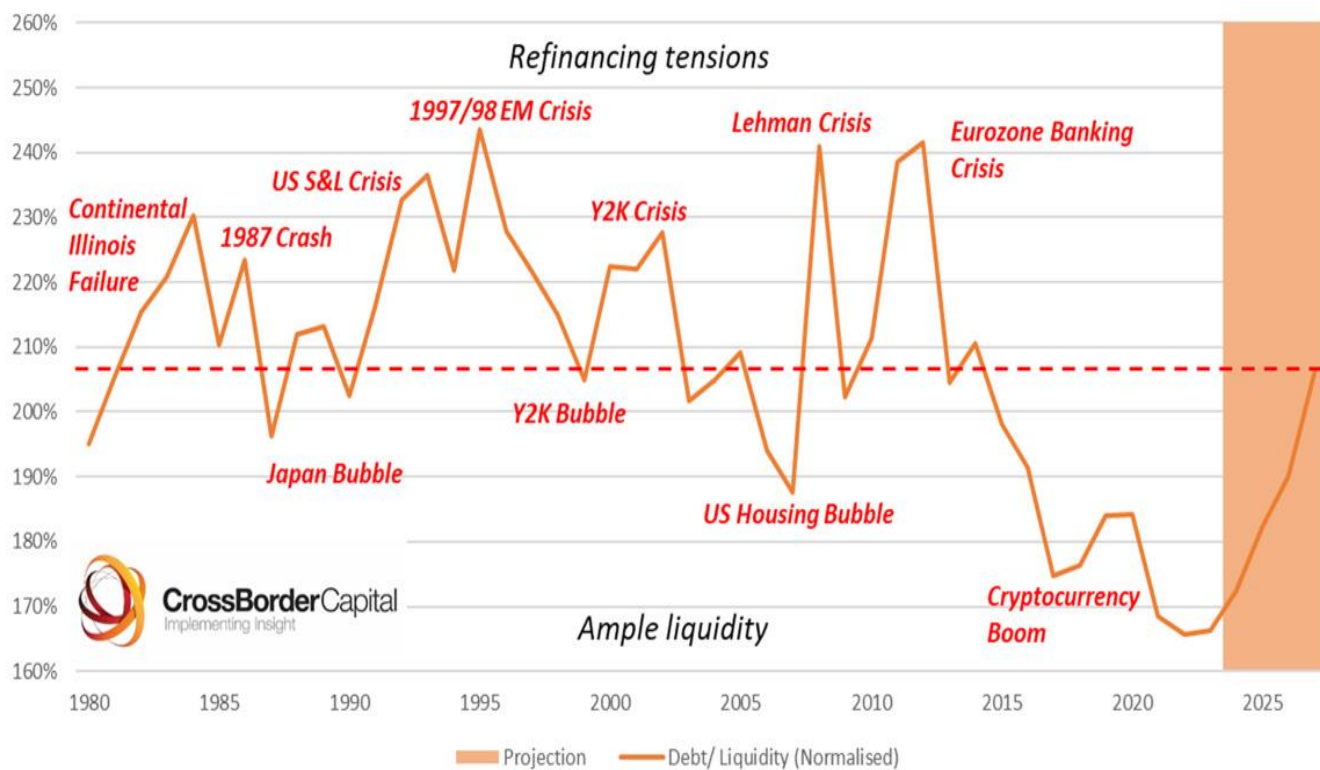

On the other hand, if the economy weakens faster than expected, it could prod central banks to begin increasing global liquidity.

And all this happens at a time that economies, world over, have added tremendous debt. Higher debt means a bigger need to refinance, which sucks up liquidity.

Again, from CrossBorderCapital, historically, when refinancing begins to use up liquidity, it's caused economic and stock market problems. We are headed in that direction again.

Advanced Economies' Debt as % Domestic Liquidity Stock

What's this mean for your portfolio?

For the last 15+ years, every time the market has declined, the Fed has stepped in to prop it up.

How?

By firing up the proverbial "printing presses" and added liquidity.

Our concern is that this has led many investors into a false sense of security. After all, why worry about managing risk if the Fed does it for you?

But with inflation and our debt, this may no longer be the case. As such, it's up to each investor to decide what a "real" bear market could do to their portfolio and retirement.

It may make sense to employ a risk management overlay to your buy and hold approach.

If you are working with an advisor, we urge you to ask them what their plan is should the market continue to decline.

Make no mistake, we sleep much better at night knowing we have our indicators and a system to protect our clients.

Hope for the best but plan for the worst.

If you're not a client, what should you do with this information?

Prepare!

Do not sell all your investments. Do not put it all into gold or hide it under your bed.

But also, do not ignore it.

Procrastination and Planning both start with a P, but they are not the same.

***Failing to prepare,
is preparing to fail.***

Come to a seminar and find out how you might protect yourself. In our seminars, and at initial, free, consultations called “Financial Physicals” we discuss the five areas most important to financial health for retirees or those close to retirement.

1. Protection
2. Estate Planning
3. Income Tax
4. Retirement
5. Investments

Risk management is key for success in all of those areas.

Consider exploring how you might add a defensive strategy to your investment approach.

Maybe this time is different, and if you’re a buy and hold investor with no defensive strategy, you’re betting your portfolio, and possibly your retirement, on it.

Attend a seminar or call the office to find how adding a defensive strategy to your portfolio could help because...

Sure, the market comes back, eventually...

How long can you afford your portfolio to be down significantly?

Currently risk-free rates approximate 5% compared to what the market “might” make (or more importantly lose) over the coming months, and considering the growing mountain of evidence of an oncoming recession, it seems negligent not to at least explore your options.

This is even more important if your spouse is not as savvy about investments as you are.

The Great Financial Crisis was triggered by the popping of a bubble in real-estate. ***The bubble in real-estate today is bigger by most measures.***

The Dot.com bear market was triggered by the popping of a bubble in equity valuations. ***The equity bubble is bigger today by most measures.***

Neither the Dot.com nor the Great Financial Crisis bear markets had inflation, or nearly as much debt across consumers and businesses as we have today.

If the Dot.com bubble resulted in the S&P-500 falling ~ -50% and the NASDAQ falling over ~ -80%...

If the Great Financial Crisis saw the S&P-500 fall ~ -57% and the NASDAQ falling over ~ -50%...

How much might a market fall with levels exceeding both of those along with inflation and higher leverage?

You don't have to remain locked into the same approach as you had when these risks didn't exist. You are allowed to protect yourself. You can step away and then come back when the risks decline. Call us to find out how.

It's time to focus on return of your money rather than return on your money.

If you still have the same portfolio allocation you had during the bull market, we would ask "why"? The risk profile of the economy and market has changed dramatically and will likely continue to rise. Wouldn't it make sense to adjust your portfolio to what is actually happening?

To be clear, we'll have a great buying opportunity at some point in the future. Usually that happens with the market crashing and most investors disgusted with the thought of investing. If you lose much of your net worth, participating will be difficult.

"You can't buy low if you don't sell high."

Patience and asset protection will be key.

Don't wait until you have suffered unrecoverable losses before taking action.

In the Great Financial Crisis, the S&P-500 fell 24% from the start on October 9, 2007 until the Lehman bankruptcy on September 15, 2008. That was close to a year, and not that far off from what we've lived through so far.

Then in just over a month from September 15, 2008 to October 27, 2008 the S&P-500 fell **ANOTHER** 28.8%. And from September 15, 2008 to the ultimate bottom, about 5 months later, it fell **ANOTHER** 43%.

Not only do bear markets normally unfold in three stages with the last being the most virulent, it also demonstrates that risk happens slowly and then all at once.

What is your defensive plan? There's still time.

Call or attend a seminar to hear about ours.

Remember, we have a feature on our website to help you measure your risk tolerance. The problem with trying to decide how much risk to take is we all want to be aggressive when the market is going up, but conservative when it's going down. That's why a sell discipline is important. However, the first line of defense is always our allocation. This approach to measuring risk gives a number by making investors trade off gains and losses. Just click the button to see where you stand.

What's Your Risk Number? 

Get a physical! We invite you to attend a seminar and come in for a “financial physical”, even if you think your current approach is fine. Much like going to the doctor for a physical despite feeling great, you want to make sure any negative issues you may not be aware of are caught early and addressed. For example...

- Do you need a process to help manage losses during the next bear market?
- Have you addressed your investment process and adjusted it for what is going on in the world?
- If not, what are you waiting for?

At the bottom of the 2007 - 2009 bear market the S&P-500 index returned to levels last seen in 1996.

The drop didn't retrace only a few months or even a couple years.

We discuss many of these issues and more on the weekly radio show and invite you to listen.

WEEKLY FOCUS – THINK ABOUT IT

“Global Liquidity.”

The Barclays Global Aggregate Bond Index (formerly Lehman Brothers Global Aggregate Index), is an unmanaged market-capitalization-weighted benchmark, and tracks the performance of investment-grade fixed income securities denominated in 13 currencies. The index reflects reinvestment of all distributions and changes in market prices.

The Barclays U.S. 1-10 Year TIPS Index is an unmanaged index composed of inflation-protected public obligations of the U.S. Treasury that have a remaining maturity of one to ten years.

The Barclays U.S. Aggregate Bond Index is an unmanaged benchmark index composed of U.S. securities in Treasury, Government-Related, Corporate, and Securitized sectors. It includes securities that are of investment-grade quality or better, have at least one year to maturity, and have an outstanding par value of at least \$250 million.

The Barclays U.S. TIPS Index is an unmanaged index composed of all U.S. Treasury Inflation-Protected Securities rated investment grade, have at least one year to final maturity, and at least \$250 million par amount outstanding.

The Barclays U.S. Treasury Index is an unmanaged index composed of U.S. Treasuries.

The CDX IG 12 is a benchmark high-grade derivatives index, which measures the cost of insuring a basket of U.S. investment-grade corporate debt against defaults.

The Chicago Board Options Exchange Volatility Index (VIX) tracks the expected volatility in the S&P 500 over the next 30 days. A higher number indicates greater expected volatility. Common usage: The Chicago Board Options Exchange Volatility Index (VIX), a barometer of market volatility.

The Dow Jones Industrial Average is a widely followed market indicator based on a price-weighted average of 30 blue-chip stocks that trade on the New York Stock Exchange which are selected by editors of The Wall Street Journal.

The Dow Jones Wilshire Real Estate Securities Index (RESI) is used to measure the U.S. real estate market and includes both real estate investment trusts (REITs) and real estate operating companies (REOCs). It is weighted by float-adjusted market capitalization.

The JP Morgan Emerging Market Bond Index is a total-return, unmanaged trade-weighted index for U.S. dollar-denominated emerging-market bonds, including sovereign debt, quasi-sovereign debt, Brady bonds, loans, and Eurobonds.

The JP Morgan EMBI Global Diversified Index tracks the performance of external debt instruments (including U.S.-dollar-denominated and other external-currency-denominated Brady bonds, loans, Eurobonds and local market instruments) in the emerging markets.

The JP Morgan GBI-EM Global Diversified Index tracks the performance of local-currency bonds issued by emerging market governments.

The MSCI World Index is a free float-adjusted market capitalization weighted index that is designed to measure the equity market performance of developed markets. The MSCI World Index represents 23 developed market countries.

The MSCI All Country World Index is a market-capitalization-weighted index composed of over 2,400 companies, and is representative of the market structure of 46 developed and emerging market countries. The index is calculated with net dividends reinvested in U.S. dollars.

The MSCI EAFE Index is an unmanaged, market-capitalization-weighted equity index that represents the developed world outside North America.

The MSCI Emerging Markets Index is a free float-adjusted market-capitalization-weighted index designed to measure the performance of global emerging market equities.

The NASDAQ Composite Index is a market-value-weighted index of all common stocks listed on the National Association of Securities Dealers Automated Quotations (NASDAQ) system.

The Russell 1000 Index includes 1000 of the largest U.S. equity securities based on market cap and current index membership; it is used to measure the activity of the U.S. large-cap equity market.

The Russell 2000 Index includes 2000 small-cap U.S. equity names and is used to measure the activity of the U.S. small-cap equity market.

The S&P 500 Index is a capitalization-weighted index made up of 500 widely held large-cap U.S. stocks in the Industrials, Transportation, Utilities and Financials sectors.

Investing Terminology

Alpha is a measure of a portfolio's return above a certain benchmarked return.

Alternative Investments are investments that are not one of the three traditional asset types (stocks, bonds and cash). Alternative investments include hedge funds, managed futures, real estate, commodities, and derivatives contracts.

Asset-Backed Securities (ABS) are bonds backed by a pool of loans or accounts receivable and commonly include payments from credit cards, auto loans and mortgage loans.

Austerity refers to measures taken by a country's government in an effort to reduce expenditures and a budget deficit.

Beta is a measure of the volatility or systematic risk of a security or a portfolio in comparison to the market as a whole.

Book-to-Price Ratio is the inverse of the price-to-book ratio, which is calculated as the market value of a security divided by its book value. A lower the price-to-book ratio for a security may mean the security is undervalued, and vice versa (the higher the book-to-price ratio, the better the value).

Commercial Mortgage-Backed Securities (CMBS) are pools of commercial mortgage loans that are packaged together and sold to the public. They are usually structured in tranches, or classes of risk, so that investors can determine how much risk they want to take on. In general, CMBS carry less prepayment risk than loans backed by residential mortgages.

Corporate Bonds are debt securities issued by corporations to raise money; these bonds usually pay higher coupon rates than government or municipal bonds.

Correlation Risk refers to the change in the marked to market value of an asset when the correlation between the underlying assets changes over time.

Credit Ratings are an assessment of the risk of default of a company or country. The higher the credit quality (or rating), the lower the perceived risk of default.

Cyclical Sectors or Stocks are those whose performance is closely tied to the economic environment and business cycle. Managers with a pro-cyclical market view tend to favor stocks that are more sensitive to movements in the broad market and therefore tend to have more volatile performance.

Debt-to-Equity Ratio is calculated as long-term debt divided by common shareholders' equity, and measures the amount of a firm's leverage, or debt.

Donor Advised Funds are private funds administered by a third party and created for the purpose of managing charitable donations on behalf of an organization, family, or individual.

Duration is a measure of a security's price sensitivity to changes in interest rates. Specifically, duration measures the potential change in value of a bond that would result from a 1% change in interest rates. The shorter the duration of a bond, the less its price will potentially change as interest rates go up or down; conversely, the longer the duration of a bond, the more its price will potentially change.

Excess Returns are investment returns from a security or portfolio that exceed a benchmark or index with a similar level of risk.

Grantor Retained Annuity Trust is an estate planning technique that minimizes the tax liability existing when intergenerational transfers of estate assets occur. An irrevocable trust is created for a certain term or period of time. The individual establishing the trust pays a tax when the trust is established. Assets are placed under the trust and then an annuity is paid out every year. When the trust expires, the beneficiary receives the assets estate and gift tax free.

High Yield Debt is rated below investment grade and is considered to be riskier.

Managed Futures strategies use futures contracts as part of their overall investment strategy. They provide portfolio diversification among various types of investment styles and asset classes to help mitigate portfolio risk in a way that is not possible in direct equity investments.

Market Capitalization is calculated as the number of companies shares outstanding multiplied by the share price, and is used to determine the total market value of a company.

Momentum is the rate of acceleration for an economic, price or volume movement; it is used to locate trends within the market.

Mortgage-Backed Securities (MBS) are pools of mortgage loans that are packaged together and sold to the public. They are usually structured in tranches, or classes of risk, so that investors can determine how much risk they want to take on.

Option-adjusted spreads estimate the difference in yield between a security or collection of securities and comparable Treasuries after removing the effects of any special features, such as provisions that allow an issuer to call a security before maturity.

Peripheral Eurozone Countries are those countries in the Eurozone with the smallest economies.

Price-to-Book Ratio is calculated as the market value of a security divided by its book value. A lower the price-to-book ratio for a security may mean the security is undervalued.

Private Foundations are charitable organizations that do not qualify as public charities by government standards. A private foundation is a nonprofit organization which is usually created via a single primary donation from an individual or a business and whose funds and programs are managed by its own trustees or directors.

Quantitative Easing refers to expansionary efforts by central banks to help increase the supply of money in the economy.

Recapitalized/recapitalization refers to injecting fresh equity into a company or a bank, which can be used to absorb future losses. This generally takes place through the company issuing new shares. In the case of a government or organization recapitalizing a bank, it usually results in the government or organization owning a stake in the bank.

Spreads: Yield spreads represents the difference in yields offered between corporate and government bonds. If they tighten, this means that the difference has decreased. If they widen, this means the difference has increased.

Standard Deviation: Statistical measure of historical volatility. A statistical measure of the distance a quantity is likely to lie from its average value. It is applied to the annual rate of return of an investment, to measure the investment's volatility (risk). Standard deviation is synonymous with volatility, in that the greater the standard deviation the more volatile an investment's return will be. A standard deviation of zero would mean an investment has a return rate that never varies.

Treasuries are U.S. government debt obligations that are backed by the full faith and credit of the government. Often, they are used as a proxy for a risk-free asset when comparing other risky assets.

Yield Curves illustrate the relationship between the interest rate, or cost of borrowing, and the time to maturity. Yields move inversely to prices. The Barclays Capital 1-10 Year US TIPS Index: Barclays Capital 1-10 Year US TIPS Index measures the performance of inflation-protected public obligations of the U.S. Treasury that have a remaining maturity of one to ten years.
